Practical Data Science
(KNN & Naïve Bayes)

Write python scripts to perform any mathematical operations while solving the following problems.

Problem 1: KNN Classifier

The table below provides a training data set containing six observations, three predictors, and one qualitative response variable.

Obs.	x_1	x_2	x_3	y
1	3	0	0	Blue
2	0	1	3	Blue
3	1	0	1	Blue
4	0	1	0	Red
5	1	1	1	Red
6	0	2	0	Red

Suppose we wish to use this data set to make a prediction for y when $x_1 = x_2 = x_3 = 0$ using K-nearest neighbors.

a. Compute the Euclidean distance between each observation and the test point
b. Use the Euclidean distance to find the prediction with K=1
c. Use the Euclidean distance to find the prediction with K=3

Problem 2: Applying Naïve Bayes Algorithm on Continuous & Categorical Data

Given the training data in the table below (*Tennis* data), predict the class of the following new example using Naïve Bayes classification: outlook=overcast, temperature=60, humidity=62, windy=false. Assume Gaussian distribution for numerical attributes and use Laplace's Correction factor while estimating likelihoods.

Practical Data Science
(KNN & Naïve Bayes)

outlook	temperature	humidity	windy	play
sunny	85	85	false	no
sunny	80	90	true	no
overcast	83	86	false	yes
rainy	70	96	false	yes
rainy	68	80	false	yes
rainy	65	70	true	no
overcast	64	65	true	yes
sunny	72	95	false	no
sunny	69	70	false	yes
rainy	75	80	false	yes
sunny	75	70	true	yes
overcast	72	90	true	yes
overcast	81	75	false	yes
rainy	71	91	true	no
